The Indus Script: Text and Context
A Statistical-Positional
Analysis of Significant Text Segments

THE INDUS SCRIPT: TEXT AND CONTEXT
A STATISTICAL-POSITIONAL ANALYSIS OF SIGNIFICANT TEXT
SEGMENTS

(Sundar Ganesan, Chandrasekhar Subramanian, Suresh Babu, Suvidha Nair, and
Iravatham Mahadevan)*

1. Scope of the paper

While the total number of signs and sign combinations in the Indus texts is large, the texts can be segmented into much smaller numbers of signs, sign pairs and sign triplets (The segmentation procedures are well-known and are not included in this paper)¹. If these significant segments are analysed textually and contextually, one can extract the core of information recorded in the texts (Statements 1.1 to 4.3 attached). Such a study will not only save much time and labour, but also hopefully show the way to further progress in understanding the Indus texts. The analysis makes no assumptions about the language of the texts or the sounds or meanings of the signs.

2. Source:

The attached statements are derived from the computer database (henceforth M77) compiled at the TIFR by Iravatham Mahadevan et al (1977 - 80) and the pictorial version in the book '*The Indus Script: Texts, Concordance and Tables*' (Mahadevan 1977).

3. Significant Text Segments:

3.1 Signs: There are 417 signs with a total of 13372 occurrences in M77. However, only 153 signs occurring 10 times or more account for as much as 94.24 percent of the total sign occurrences.

3.2 Sign pairs: There are 2758 sign pairs in M77, but only as few as 166 pairs occur 10 times or more (excluding those commencing with signs '1, " or '), or with U or ^ (these two with some exceptions such as EU, AU, E^), or with J which do not occur initially in significant pairs).

* Indus Research Centre, Roja Muthiah Research Library, Chennai

¹ Mahadevan(1978), Nisha Yadav, et al. (2008)

3.3 Sign triplets: There are 3710 triplets in M77; but only as few as 68 triplets occur 10 times or more (excluding those commencing with signs ^l, ^u, ^l; [↑] and ^U; and [∫] which do not occur initially in significant triplets).

The exclusions and exceptions are based on segmentation analysis (not included in this paper). Thus 153 signs, 166 sign pairs and 68 sign triplets have been identified as significant text segments for further analysis.

4. Textual Analysis: (Statements 1.1 to 1.3)

The selected signs, pairs and triplets are listed in the order of total frequencies as well as in the order of positional frequencies (solus, initial, medial and final).

The preliminary analysis shows that the significant text segments can be classified broadly into only two categories, viz., one including solus and initial occurrences, and the other of final occurrences. The medial occurrences may belong to either category depending on whether they are quasi-initial (that is, word-initial segments occurring in the middle) or quasi-final (that is, word-final segments occurring in the middle). (Signs may occur in solus / initial and final positions with respect to a line of text, but not generally with respect to the whole text. Exceptions to this pattern require further study and may include errors in coding.)

5. Context Analysis:

5.1 Parameters: The following three parameters have been chosen for context analysis:

- (1) Sites: Inscribed objects from 19 Harappan and 5 West Asian sites have been included in M77. However, only four sites, viz, Mohenjodaro (MD), Harappa (HP) Lothal (LL) and Kalibangan (KB) (yielding a minimum of 100 inscribed objects each) account for 2789 out of 2906 objects (95.97%).
- (2) Object types: 2906 inscribed objects classified into 9 types have been included in M77. However, only 5 types, namely seals, sealings, miniature tablets, copper tablets and pottery graffiti each with a minimum of 100 occurrences, account for as much as 98.11% of the total.

- (3) Field symbols: 99 field symbols (that is, pictorial or iconographic motifs occupying the field as distinguished from signs of the Indus script) are listed in M77. However only 17 field symbols with a minimum of 10 occurrences each account for 84.97 % of the total. The field symbols 35 (uncertain animal), 97 (geometrical patterns), 98 (ornamental borders) and 99 (damaged or illegible) are not considered. See attached list of selected Significant Field Symbols.

5.2 Analytical Statements (Attached):

The significant text segments (signs, pairs and triplets) are analysed with respect to the selected parameters (site, object type and field symbol) in the attached statements.

5.3 Locus and Stratigraphy – not included:

We would have liked to include another important parameter, namely the locus and stratigraphy of inscribed objects. Statistics on locus and stratigraphy available in respect of MD, HP and CH are included in the computer data base (M77) but not published in Mahadevan 1977. However, due to the pre-modern techniques of excavation, true stratigraphy has not been scientifically recorded for these sites (Mythili Rangarao and Iravatham Mahadevan 1987). When the original Field Notes are fully published, such context analysis may become possible.

6. Some Preliminary Results

6.1 Frequency-Distribution Analysis of frequent signs by sites (Statement 2.1):

The total sign occurrences in M77 (13372) are distributed in the major sites as follows:

Site	Sign occurrences	Percent
MD	7281	54.45
HP	4359	32.60
LL	760	5.68
KB	423	3.16
Total	12823	95.89

The enclosed statement (Statement 2.1) highlights cases of significant deviations from the expected normal frequency of sign occurrences. Some examples are given below.

Sign	MD	HP
Ǝ	101	239
U	28	288
	120	175
AE	68	84

The observed deviations from normal distribution prompt us to seek explanations. In these particular cases, the deviations may be due to sites. However, that this is not the sole cause can be seen from the following analysis of sign occurrences with respect to object types (Statement 3.1).

6.2 Frequency-Distribution Analysis of frequent signs by object types (Statement 3.1):

The total sign occurrences in M77 (13372) are distributed among the major object types as follows:

Object types	Sign Occurrences	Percent
Seals	8312	62.16
Sealings	2582	19.31
Miniature Tablets	1261	9.43
Copper Tablets	718	5.37
Pottery Graffiti	281	2.10
Total	13154	98.37

6.2.1 Miniature Tablets: Sign U (7th in the order of total frequency) overtakes even the most frequent sign U and is ranked first on miniature tablets. Similarly the sign Ǝ which shows abnormal deviation with respect to sites (more in HP than in MD), also has equally abnormal deviation with respect to object types, preferring miniature tablets to seals. Thus it appears that the main cause of deviation in these cases is the object type and not the site. However, miniature tablets do not at all occur in MD probably because the lowest levels could not be reached due to the much higher water table in modern times.

6.2.2 Copper Tablets: The copper tablets occur only at MD and at no other site. In this case, there is clear correlation between object type and site. One may say that copper tablet - using people lived only at Mohenjodaro (in the Late Period as known from stratigraphic evidence).

Another important feature relating to copper tablets is that some frequent signs do not occur on them with expected frequencies. Examples:

- (1) The following frequent signs do not occur at all on copper tablets:

- (2) On the other hand, the following signs occur relatively much more often on copper tablets:

An important result is that some similar-looking signs are not really sign-variants but separate and independent signs as revealed by the evidence of copper tablets. For example:

6.3 Frequency-Distribution Analysis of frequent signs by Field Symbols (Statement 4.1):

All selected signs occur at least once with FS=01 (Unicorn).
 The FS=16 (Hare) occurs only with signs 
 The sign  and ,  and  occur most frequently with FS=83 (Dot in circle).
 Sign  occurs most frequently with FS=14 (Ox-Antelope).

7. Analysis of Sign Pairs and Triplets

Similar analysis with respect to the other significant text segments (pairs and triplets) has been carried out with respect to the selected parameters (Statements 1.2, 1.3, 2.2, 2.3, 3.2, 3.3, 4.2 and 4.3).

7.1 Textual and Contextual Analysis of Pairs and Triplets

- (1) Of the 166 pairs selected, 33 start with Number signs (19.5%) and 25 start with a fish sign (14.8%). Similarly, 38 of the 166 pairs end with the Jar sign (22.5%) and 16 end with fish signs (9.5%).

(2) The sign pair "◇ occurs mostly in the initial position with a frequency of 254 out of 291, mostly on seals and sealings but does not occur on copper tablets, while EU occurs mostly in the final position with a frequency of 179 out of 184, occurs mostly on miniature tablets and sealings and does not occur on copper tablets. The greater affinity for the former pair is towards MD along with the field symbol Unicorn, while for the latter it is Harappa along with the field symbols Gharial / Dot in circle.

(3) The following pairs occur neither in initial nor final positions: U𑀓, "𑀓, 𑀓, 𑀓, 𑀓. U𑀓 occurs mostly in MD along with FS=14 (Ox-Antelope) and mostly on copper tablets and one occurrence on sealings; "𑀓 in HP along with FS=01 (Unicorn) and only on sealings and seals; 𑀓 only in MD along with FS=14 (Ox-Antelope) only on copper tablets; 𑀓 mostly in MD along with FS=01 (Unicorn) mostly on copper tablets and seals.

(4) The following triplets occur more frequently as solus and therefore may represent a complete phrase: EU𑀓 (f=41) occurs mostly in Harappa along with FS=83 (Dot in circle) mostly on miniature tablets and never on copper tablets or pottery; U𑀓 (f=14) (FS – 01 (Unicorn), 07 (Elephant) and 91 (Shape of Double shield or Double-axe)) mostly in HP and mostly on miniature tablets; 𑀓 (f=12) occur mostly in HP along with FS=44 (Kino tree) and FS=01 (Unicorn) mostly on seals and sealings; 𑀓 (f=11) occur mostly in MD and HP along with FS=01 (Unicorn) and FS=83 (Dot in circle) mostly on seals and miniature tablets.

(5) The FS=16 (Hare) occurs only with the following triplets: 𑀓𑀓𑀓, 𑀓𑀓𑀓, 𑀓𑀓𑀓, 𑀓𑀓𑀓 and 𑀓𑀓𑀓.

(6) The pair U𑀓 and the triplet EU𑀓 show much greater affinity to Harappa (site), Miniature tablets (type) and Dot in circle (field symbol).

(7) The significant text segments do not appear to have special affinity to field symbols with which they are associated on seals and sealings. This is also shown by the simple observation that the same text occurs with different field symbols and vice versa. However, one notable exception is the association of significant text segments with particular field symbols on the copper tablets, (e.g. texts with the field symbol 'hare facing a bush').

8. Preliminary Conclusions

Our exercise is confined to the statistical analysis of position and frequency of the textual segments and their special affinity to the background such as site, object type and field symbol.

We wish to emphasize that the choice of frequent segments and frequent parameters would enable us to extract the core of available information of the Indus Script with minimum effort. This is a preliminary exercise and our expectation is that this study will show the way for reaching other areas not covered in this study.

One of our goals is to ascertain the language of the Indus Script through a study of its textual segments; we have in mind the work of Emil Forrer (1932) who studied the Hittite hieroglyphic script through such methods even before deciphering the script.

Enclosure: List of attached statements

List of attached statements:

- 1.1 - Positional Distribution of Selected Signs: Within a Line of Text
- 1.2 - Positional Distribution of Selected Pairs: Within a Line of Text
- 1.3 - Positional Distribution of Selected Triplets: Within a Line of Text
- 2.1 - Frequency Distribution of Frequent Signs by Major Sites
- 2.2 - Frequency Distribution of Frequent Pairs by Major Sites
- 2.3 - Frequency Distribution of Frequent Triplets by Major Sites
- 3.1 - Frequency Distribution of Frequent Signs by Object Types
- 3.2 - Frequency Distribution of Frequent Pairs by Object Types
- 3.3 - Frequency Distribution of Frequent Triplets by Object Types
- 4.1 - Frequency Distribution of Frequent Signs by Field Symbol
- 4.2 - Frequency Distribution of Frequent Pairs by Field Symbol
- 4.3- Frequency Distribution of Frequent Triplets by Field Symbol

List of Selected Significant Field Symbols

Field Symbol	Description
01	Unicorn, generally facing a special cult object
03	Humped Bull
04	Short-horned bull, generally with head lowered over a trough
06	Buffalo, generally with a trough in front
07	Elephant, sometimes with a trough in front
09	Tiger, generally with a trough in front
11	Rhinoceros, generally with a trough in front
13	Goat-antelope with a short tail (and different types of horns), sometimes with a trough in front
14	Goat-antelope with a long tail, generally with a trough in front
16	Hare facing a bush
25	Fabulous animal with the body of a ram, horns of a bull, trunk of an elephant, hind legs of a tiger and an upraised serpent-like tail
36	Gharial, sometimes with a fish in its jaw and/or surrounded by a school of fish.
37	Inscribed object in the shape of a fish
44	Kino tree, generally within a railing or on a platform
83	One or more dotted circles
85	The special cult object (the so-called 'manger' or 'incense-burner')
91	Inscribed object in the shape of a double-shield or double-axe (?)
